Abstract

Optoelectronic module, and method for the production thereof

invention relates to an optoelectronic module The having a carrier element, at least one semiconductor component for emitting or detecting electromagnetic radiation, said semiconductor component being applied the element carrier being electrically and on conductively connected and having a radiation coupling area, and also at least one optical device assigned to the semiconductor component. A connecting layer made of radiation-transmissive, deformable material arranged between the radiation coupling area and the device, optical optical the device the and semiconductor component being fixed relative to one another in such a way that they are pressed against one another and that the connecting layer is thereby squeezed in such a way that it generates a force that strives to press the optical device and the radiation coupling area apart.

The invention furthermore relates to a method for producing such an optoelectronic module.
